

# Project Report: VORA E-Commerce SPA

## 1. Implemented Features

- API Integration: Asynchronous data fetching from the `/products` endpoint using the Fetch API.
- Search & Filtering: Real-time search functionality and category-based sorting to enhance user experience.
- Detail View: A dedicated dynamic route to display comprehensive information for each product.
- Global State: Centralized state management using Pinia stores for the Shopping Cart, Authentication, Search, and Theme settings.[cite: 1]
- Authentication: A complete simulation of user Login and Registration with persistent JWT storage in `localStorage`. [cite: 1]
- Routing: Structured navigation and page management implemented via Vue Router.[cite: 1]
- Dark Mode: A professional custom design system with full support for light and dark themes.[cite: 1]

## 2. Architecture Explanation

- App.vue: Acts as the main entry point and master layout, managing the visibility of the NavBar, Footer, and the dynamic Router-View.[cite: 1]
- Views: Isolated components representing separate pages, such as Home, Product Details, Cart, Checkout, Login, and Register.[cite: 1]
- Components: Modular and reusable UI elements, like ProductCard, designed to follow DRY (Don't Repeat Yourself) principles.[cite: 1]
- Stores: Implementation of centralized logic for state management, enabling smooth data flow between unrelated components (e.g., the Search bar in the NavBar instantly updating the HomeView).[cite: 1]
